
MsiDiff 2022 [New]

MsiDiff helps to compare an MSI/MSI1/MSI2/MSI3 and MSI1/MSI2/MSI3 database and shows the differences. MsiDiff shows you the type of entry and the property value. You can see whether a checkbox is checked or not, whether a value is empty (not set) or not. You can compare the values in the properties. You can compare a folder with its children and grand children MSI diff is a command line tool that performs a comparison of an MSI database and calculates the SHA1 checksum of the database. It performs a comparison of the main database and its child databases. The output of the comparison is shown in an easy to read tabular format. It is not suited for on-the-fly comparisons, but can be used after a database is installed (e.g. to change the package descriptions or to apply the patch version of the package).

Fuller and more detail description The two most important editions of Windows Installer (MSI) are: * The "compact" package format MSIs which are the default installation types and can be deployed to any computer regardless of operating system. * The "basic" package format. This is the most commonly used installation type and is recommended for user installs. It is generally intended for desktop computers. The difference between basic and compact installs is that a basic installation may contain multiple MSI packages while a compact installation is generally one package only. Currently most Windows operating systems are "compact" installs. These were created with earlier versions of Windows Installer but the current version is generally considered to be the "basic" installer format with exceptions for Windows 10 (service). Since Windows Installer was first introduced in 1999 there have been multiple iterations of the installer and is still evolving. These changes include changing the underlying package format that is used, changes to the design of the installer, changes to the underlying infrastructure such as the registry and local application data locations, and various improvements to the design and features. History Beginning with the installation of Windows XP in 2001 when Windows Installer 1.0 was introduced, the format was evolved and used for the installer. In Windows XP Service Pack 2 (installed in 2004) the release notes mention New installers will use the basic package format to improve compatibility With later releases of Windows, such as Windows Vista and later operating systems, the installer
